Computer Organization – HW2

Email: iustCompOrg+4022@gamil.com

1. Write the control signals of the single-bus processor below for the following instructions (be careful with the addressing modes).

   a. (mem1) + (mem2) = R1

   b. (mem1) - (R1) = mem2

   c. (mem1) - R1 = (mem2)

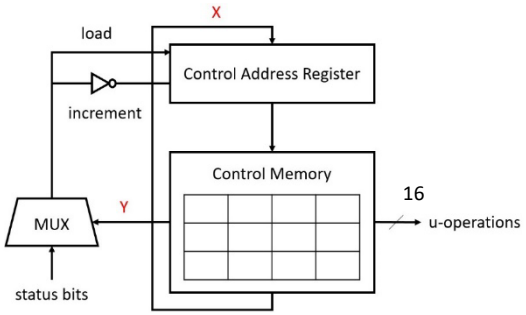
   c. Conditional Jump relative
   (PC + offset in N and END in ~~N~~)

2. Answer the following questions:
   - Describe “BUS multiplexing”.
   - Describe “Daisy Chain” interrupt handling system.

3. Following circuit is considered for a microprocessor which the microinstructions stored in instruction memory (also known as control memory) have a width of 32 bits. These microinstructions are broken down to three fields:

   1) Micro-Operation field (16 bits)
   2) Next address field (X)
   3) Status bits of MUX (8 bits)

   Calculate number of bit in X and Y.
   What is the size of the memory?



4. Write RISC-V assembly code to calculate n! (n! = 1 ×2 × … ×n)

5. What is ISA? What are the main differences between instruction sets such as Intel x86, ARM, RISC-V and MIPS?

6. In the following assembly code, how many times instruction memory, data memory and register bank have been accessed? Fill the table and write a full description about every line of code.

Assembly Code:

```
LOAD R0, M40      (Loads the content of M40 in R1)
LOAD R1, M41      (Loads the content of M41 in R2)
ADDI R2, R0, R1   (Add the contents of R1 and R0 -> R2)
STORE M42, R2     (Stores the contents of R2 in M42)
HALT
```

Code lines	Register Bank	Instruction Memory	Data Memory
Line 1			
Line 2			
Line 3			
Line 4			
Line 5			

7. In a computer, the length of instructions is 16 bits, and the address fields are 4 bits each. If this processor has 15 different "two-operand instructions" and 23 "one-operand" instructions, what is the number of zero-operand instructions?

instruction [15:12]	instruction [11:8]	instruction [7:4]	instruction [3:0]

Please submit your homework, simulations and projects in the following format:

Name_StudentNumber_HW2 (BillGates_12345678_HW2)

Good Luck!

RISC-V Reference Data Card ("Green Card") 1. Pull along perforation to separate card 2. Fold bottom side (columns 3 and 4) together

RISC-V Reference Data

Notes: 1) The Word version only operates on the rightmost 32 bits of a 64-bit registers
2) Operation assumes unsigned integers (instead of 2's complement)
3) The least significant bit of the branch address in jalr is set to 0
4) (signed) Load instructions extend the sign bit of data to fill the 64-bit register
5) Replicates the sign bit to fill in the leftmost bits of the result during right shift
6) Multiply with one operand signed and one unsigned
7) The Single version does a single-precision operation using the rightmost 32 bits of a 64-bit F register
8) Classify writes a 10-bit mask to show which properties are true (e.g., –inf, -0,+0, +inf, denorm, ...)
9) Atomic memory operation; nothing else can interpose itself between the read and the write of the memory location
The immediate field is sign-extended in RISC-V
